What is a **Digital Twin**?

*A **digital twin** is a set of **virtual information constructs** that mimics the structure, context, and behavior of a **natural**, **engineered**, or **social system** (or **system-of-systems**), is **dynamically updated** with data from its physical twin, has a **predictive capability**, and **informs decisions that realize value**. The **bidirectional interaction** between the virtual and the physical is central to the digital twin.*

Parameter Estimation and Uncertainty Basics

Assume a model and error structure:

measurement

input variables

observation error (i.i.d.)

$$y_i = m(\boldsymbol{x}_i, \boldsymbol{\theta}) + \epsilon_i \qquad \epsilon_i \sim N(0, \sigma_\epsilon^2)$$

model

parameters

What values of model parameters $\boldsymbol{\theta}$ best fit the data $\boldsymbol{X}$ and $\boldsymbol{y}$?

$$\widehat{\boldsymbol{\theta}} = \arg\min_{\boldsymbol{\theta}} \Psi \coloneqq \frac{1}{2}\sum_i [y_i - m(\boldsymbol{x}_i, \boldsymbol{\theta})]^2$$

best fit estimates

How sensitive are the least-squares objective Ψ to perturbations in $\boldsymbol{\theta}$?

$$\boldsymbol{H} = \begin{bmatrix} \frac{\partial^2\Psi}{\partial\theta_1^2} & \cdots & \frac{\partial^2\Psi}{\partial\theta_n\partial\theta_1} \\ \vdots & \ddots & \vdots \\ \frac{\partial^2\Psi}{\partial\theta_1\partial\theta_m} & \cdots & \frac{\partial^2\Psi}{\partial\theta_m^2} \end{bmatrix} \qquad \boldsymbol{Q}(\boldsymbol{\theta}) = \begin{bmatrix} \frac{\partial m(x_1,\boldsymbol{\theta})}{\partial\theta_1} & \cdots & \frac{\partial m(x_1,\boldsymbol{\theta})}{\partial\theta_m} \\ \vdots & \ddots & \vdots \\ \frac{\partial m(x_n,\boldsymbol{\theta})}{\partial\theta_1} & \cdots & \frac{\partial m(x_n,\boldsymbol{\theta})}{\partial\theta_m} \end{bmatrix}$$

Hessian matrix $\quad \boldsymbol{H} \approx \boldsymbol{Q}^T\boldsymbol{Q} \quad$ sensitivity matrix

How does measurement uncertainty ϵ propagate into uncertainty about the regressed parameters $\hat{\theta}$?

covariance matrix for $\widehat{\boldsymbol{\theta}}$ $\qquad \boldsymbol{V}_{\widehat{\boldsymbol{\theta}}} \approx \sigma_\epsilon^2 \boldsymbol{H}^{-1} \approx \sigma_\epsilon^2 (\boldsymbol{Q}^T\boldsymbol{Q})^{-1}$

Fisher information matrix for $\widehat{\boldsymbol{\theta}}$ $\qquad \boldsymbol{M}_{\widehat{\boldsymbol{\theta}}} \approx \boldsymbol{V}_{\widehat{\boldsymbol{\theta}}}^{-1} \approx \frac{1}{\sigma_\epsilon^2}(\boldsymbol{Q}^T\boldsymbol{Q})$

Extensions not shown: sophisticated error structures, Bayesian or MLE inference, …

Getting Started with Pyomo.DoE

Documentation: https://pyomo.readthedocs.io/en/stable/contributed_packages/doe/doe.html

Pyomo.DoE

Pyomo.DoE (Pyomo Design of Experiments) is a Python library for model-based design of experiments using science-based models.

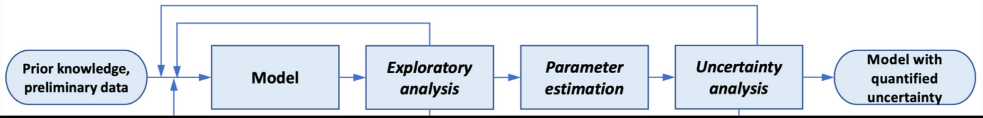
Pyomo.DoE was developed by **Jialu Wang** and **Alexander W. Dowling** at the University of Notre Dame as part of the Carbon Capture Simulation for Industry Impact (CCSI2). project, funded through the U.S. Department Of Energy Office of Fossil Energy.

If you use Pyomo.DoE, please cite:

[Wang and Dowling, 2022] Wang, Jialu, and Alexander W. Dowling. "Pyomo.DOE: An open-source package for model-based design of experiments in Python." AIChE Journal 68.12 (2022): e17813. *https://doi.org/10.1002/aic.17813*

Methodology Overview

Model-based Design of Experiments (MBDoE) is a technique to maximize the information gain of experiments by directly using science-based models with physically meaningful parameters. It is one key component in the model calibration and uncertainty quantification workflow shown below:



ParmEst and Pyomo.DoE Development Plans

Coming soon:

- Improved initialization
- Improved optimization performance
  - NLP decomposition
  - Grey-box objective calculations
- Improved modeling abstraction
  - Multiple experiments (e.g., planning batches)
  - Parameter uncertainty
- More applications, examples, and collaborations
- End-to-end uncertainty workflow (via interface with PyROS)

Acknowledgements
